Privacy and Consent Note

What we store, why, and how it is limited

VisionGuard can recognise people, so it handles personal data. This note says what is stored and how it is limited.

What is stored

Data	Stored?	Where / notes
Face templates	Yes	Numbers only, no photographs. In `data/faces/faces.db`. Deleting a user removes all their templates.
Unknown-person and weapon snapshots	Yes (default on)	Face crop plus annotated frame in `data/snapshots`. The config marks it as personal data. Turn off with `save_snapshots: false`.
Event log	Yes	Time, camera, event type and the name if the person was recognised.
Live video	Analysed as it arrives	Shown on the dashboard to authorised viewers.

Consent and use

- A person is enrolled only by an operator in the Face Registry. **Consent must be obtained before enrolling anyone.**
- People who are not enrolled are shown as 'unknown'; they are not named.
- Intended for places where people are told cameras are in use. Not for covert surveillance.
- Identity modules can be switched off on the Modules page.

Protection

- Dashboard listens on localhost by default. Any network address requires a token.
- Changes sent from another website are refused by the backend.
- The `data/` folder, including faces and snapshots, is excluded from git: the public repository holds no face database and no enrolment photos.
- Anyone can be removed on request: delete the user in the Face Registry and delete their files in `data/snapshots`.

Demo footage

Tests and the demo use the team's own footage and public clips (an abandoned-bag video and the URFall fall dataset). Sources are recorded in the project's scenario files.
